

TICKET CLASSIFICATION USING FLOW DESIGNER

ServiceNow Customer / User Journey Map

SCENARIO

Raising, automatically classifying, routing, updating, and closing an IT support ticket using ServiceNow Flow Designer.

JOURNEY MAP

STEP	WHAT DOES THE PERSON EXPERIENCE?	INTERACTIONS / TOUCHPOINTS	GOAL / MOTIVATION	POSITIVE MOMENTS	NEGATIVE MOMENTS	AREAS OF OPPORTUNITY
1. Raise Ticket	User opens the ServiceNow portal and submits an incident/request with a short description, details and relevant information.	ServiceNow portal / catalog; user device; requester and support portal.	Help me report my problem quickly and correctly.	Simple ticket creation is convenient.	Missing or unclear information can lead to incorrect classification.	Use mandatory fields, clear prompts and examples for common issues.
2. Ticket Created	ServiceNow creates the ticket and generates a unique ticket number.	Incident record; ServiceNow platform; confirmation screen/email.	Help me know that my request was successfully recorded.	Immediate confirmation provides confidence.	Users may not know what happens after submission.	Show ticket number, status and expected next step.
3. Flow Triggered	A Flow Designer flow starts when the selected trigger condition is satisfied, such as creation of a new incident.	Flow Designer; trigger conditions; incident table.	Help me avoid waiting for someone to manually process my ticket.	Automation reduces repetitive manual work.	Incorrect trigger conditions can cause a flow not to run or run unexpectedly.	Define and test trigger conditions carefully.
4. Ticket Classification	The flow examines ticket information and applies classification logic to determine category/subcategory and, where configured, priority or assignment details.	Flow Designer actions; decision/if logic; incident fields; classification rules.	Help me get my ticket classified consistently.	Automatic classification can be fast and consistent.	Ambiguous descriptions may result in wrong classification.	Use clear rules, standardized categories and fallback handling for uncertain cases.
5. Assignment & Routing	Based on the classification, the flow assigns or routes the ticket to the appropriate support group or team.	Assignment group; ServiceNow workflow/flow; support queue.	Help me reach the right team without manually redirecting my ticket.	Correct routing reduces handoffs.	Wrong routing can delay resolution.	Map categories to assignment groups and include an exception path.
6. Notification	The requester and/or assigned support team receive notifications about ticket creation, classification or assignment.	Email/in-app notification; ServiceNow activity stream.	Help me know who is handling my issue and what is happening.	Notifications improve visibility.	Too many notifications may become distracting.	Send only meaningful status and assignment updates.
7. Agent Review	A support agent reviews the automatically classified ticket and corrects the classification if needed before continuing the resolution process.	Agent workspace; incident record; activity/comments.	Help me make sure the classification is accurate.	Human review provides a safety check.	Manual correction may still be needed for complex tickets.	Capture correction reasons and use them to improve classification rules.
8. Resolution & Closure	The support team resolves the issue, records the resolution details, updates the ticket and closes it according to the process.	Incident record; resolution notes; status/closure fields.	Help me get my issue resolved and keep a useful record.	A completed ticket provides traceability.	Incomplete resolution notes can make future analysis difficult.	Require useful closure information and maintain consistent status handling.

STEP	WHAT DOES THE PERSON EXPERIENCE?	INTERACTIONS / TOUCHPOINTS	GOAL / MOTIVATION	POSITIVE MOMENTS	NEGATIVE MOMENTS	AREAS OF OPPORTUNITY
9. Feedback & Improvement	Closed-ticket data and classification corrections can be reviewed to identify common issues, routing errors and opportunities to improve the flow.	Reports/dashboards; incident data; Flow Designer configuration.	Help me avoid repeated classification and routing problems.	Data can reveal process improvements.	Poor data quality limits the value of reports.	Review misclassifications regularly and refine rules and categories.

FLOW DESIGNER PROCESS VIEW

Stage	Flow Designer / ServiceNow Activity	Expected Result
Trigger	When a new incident/ticket is created and required conditions are met	Flow starts automatically
Get / Read Data	Read relevant ticket fields such as short description, description, caller and existing category fields	Input data is available for decisions
Classification Logic	Use decision/if logic or configured classification rules to identify category and subcategory	Ticket receives a classification
Priority / Routing	Apply configured priority or routing rules where applicable	Correct urgency and support path
Assignment	Set the appropriate assignment group / responsible team	Ticket reaches the relevant queue
Notification	Send selected notifications to requester and/or support team	Stakeholders are informed
Agent Review	Agent verifies classification and corrects it when necessary	Classification is validated
Resolution	Agent resolves the ticket and records resolution details	Issue is resolved
Closure	Update the ticket to the required closed state	Ticket lifecycle is completed
Improvement	Review reports, corrections and recurring classifications	Rules and flow can be improved

KEY GOALS & MOTIVATIONS

- Help me report an issue without unnecessary effort.
- Help me get my ticket classified consistently.
- Help me avoid incorrect category or assignment.
- Help me reach the correct support team quickly.
- Help me know the current status of my ticket.
- Help support teams reduce repetitive manual classification.
- Help the organization identify recurring classification errors and improve the process.

POSITIVE MOMENTS

- Ticket is created immediately with a unique reference number.
- Classification happens automatically after the trigger.
- Correct routing reduces manual reassignment.
- Notifications keep users and support teams informed.
- Classification corrections can be used to improve future processing.

NEGATIVE MOMENTS

- Ticket description is too vague for reliable classification.
- Classification rules do not cover an uncommon issue.
- A ticket is routed to the wrong assignment group.
- Flow configuration or conditions prevent the expected automation.
- Incomplete ticket data makes reporting and improvement difficult.

AREAS OF OPPORTUNITY

- Create standardized categories and subcategories.
- Use mandatory and guided fields for better ticket data.
- Add fallback routing for tickets that cannot be confidently classified.
- Log classification decisions and corrections for analysis.
- Test Flow Designer conditions and actions with multiple ticket scenarios.
- Use dashboards/reports to monitor misclassification and reassignment trends.

Note: This document follows the structure of the supplied Guided City Tours journey-map template, but the content is adapted to the stated project topic: Ticket Classification using Flow Designer.
