

Problem – Solution Fit Template

Phase / Activity	Project Design Phase — Problem – Solution Fit
Date	3 October 2026
Project Name	Auto Ticket Classification using Flow Designer
Maximum Marks	2 Marks

Problem – Solution Fit Overview

The Problem-Solution Fit simply means that you have found a problem with your customer and that the solution you have realized for it actually solves the customer's problem. It helps innovators identify behavioral patterns and recognize what would work and why.

Purpose:

- Solve complex problems in a way that fits the state of your customers.
- Succeed faster and increase your solution adoption by tapping into existing mediums and channels of behavior.
- Sharpen your communication and messaging strategy with the right triggers.
- Increase trust by solving frequent annoyances, urgent or costly support bottlenecks.
- Understand the existing situation in order to improve it for your target group.

Problem – Solution Fit Canvas Elements

#	Canvas Block	Project Mapping Details
1	CUSTOMER SEGMENT(S) [CS]	• School Students & Teachers submitting daily IT incident requests (Wi-Fi drops, projector failures, locked accounts, slow PCs). • School IT Helpdesk Agents who manually review, categorize, and assign incoming tickets.
2	JOBS-TO-BE-DONE / PROBLEMS [J&P]	• End-Users: Need quick resolution of IT issues to continue teaching and learning activities without disruption. • IT Helpdesk: Needs to accurately identify issue types, set dependent Category and Subcategory fields, and route tickets efficiently.
3	TRIGGERS [TR]	• Occurrence of a technical disruption in a classroom or library (e.g., Wi-Fi disconnected, projector not turning on, password forgotten, PC hanging).

		• High queue volume of unclassified tickets accumulating in the helpdesk dashboard.
4	EMOTIONS: BEFORE / AFTER [EM]	• Before: Frustrated, anxious, and delayed due to slow response times and confusing manual categorization dropdowns. • After: Relieved, confident, and satisfied with instant automated acknowledgment and rapid, accurate ticket routing.
5	AVAILABLE SOLUTIONS [AS]	• Manual review and categorization by IT dispatch staff (current state — slow, error-prone, non-scalable). • Complex custom JavaScript rules or machine-learning models (high maintenance, costly, difficult to update).
6	CUSTOMER CONSTRAINTS [CC]	• Lack of technical knowledge among students/teachers regarding proper IT terminology/categories. • Time constraints during live classes preventing detailed ticket form entry. • Preference for a simple, zero-code solution that requires minimal training and easy ongoing maintenance.
7	BEHAVIOUR [BE]	• Users enter only essential fields (Caller Name and Short Description) when reporting an incident. • Users skip choosing technical Category/Subcategory dropdowns to save time.
8	CHANNELS OF BEHAVIOUR [CH]	• 8.1 Online: ServiceNow Service Portal, email submission channels, automated email notification receipts. • 8.2 Offline: Direct classroom support visits by assigned IT technician after ticket routing.
9	PROBLEM ROOT CAUSE [RC]	• Manual ticket triage processes rely entirely on human review for every incoming ticket, creating bottlenecks, human error, and prolonged response times as request volumes grow.
10	YOUR SOLUTION [SL]	• Automated Ticket Classification using ServiceNow Flow Designer: - Evaluates Short Description keywords (WiFi, Projector, Password, Slow) upon ticket creation. - Automatically sets Category and Subcategory (e.g., Network -> Wi-Fi, Hardware -> Projector). - Enforces dependent field logic and sends an instant confirmation email to the caller. - Built as a no-code, easily scalable solution packaged inside a ServiceNow Update Set.
