Auto Ticket Classification using Flow Designer

Date	03 October 2026
Team ID	SWTID-2026-5758
Project Name	Auto Ticket Classification using Flow Designer
Maximum Marks	4 Marks

Brainstorm & Idea Prioritization

Brainstorming for this project focuses on identifying practical ways to reduce the manual effort involved in school IT helpdesk ticket classification. The project source identifies manual review, category/subcategory selection, and caller notification as key parts of the existing process, and proposes no-code automation using ServiceNow Flow Designer.

Project basis: The helpdesk receives requests involving Wi-Fi, projector, password/access, and slow-computer issues. The proposed solution analyzes keywords in the short description and automatically assigns Category and Subcategory.

Step-1: Team Gathering, Collaboration and Select the Problem Statement

Selected Problem Statement

The school IT helpdesk receives multiple incident requests daily. IT staff currently review each request manually, identify the issue type, select the appropriate category and subcategory, and notify the caller. This process is time-consuming, error-prone, and difficult to scale as request volume increases.

- Manual classification of incoming IT support tickets.
- Need to assign Category and Subcategory consistently.
- Need to support dependent choices between Category and Subcategory.
- Need to send an automated confirmation email to the caller.
- Need for a maintainable and scalable no-code solution.

AUTO TICKET CLASSIFICATION USING FLOW DESIGNER

Step-2: Brainstorm, Idea Listing and Grouping

Idea / Approach	Description	Group
1. Manual Ticket Classification	IT staff review each ticket and select Category and Subcategory manually.	Current process / Problem
2. Keyword-Based Auto Classification	Use predefined keywords in the Short Description to assign Category and Subcategory automatically.	Automation idea
3. Dependent Category–Subcategory	Make Subcategory choices depend on the selected Category for consistent data entry.	Data consistency
4. Automated Email Notification	Send a confirmation email to the caller after the ticket is created and classified.	Communication
5. Update Set for Deployment	Package the configured solution in an Update Set so it can be transferred to another environment.	Deployment & reuse

Project Classification Logic

The PDF specifies four main keyword-based classification paths:

- WiFi / Network → Category: Network; Subcategory: Wi-Fi.
- Projector → Category: Hardware; Subcategory: Projector.
- Password / Login → Category: Access; Subcategory: Forgot Password.
- Slow / Hanging → Category: Performance; Subcategory: Slow Computer.

Step-3: Idea Prioritization

The project direction is organized around the requirements and automation flow documented in the project PDF. Rather than ranking alternatives, the ideas are grouped by their role in the proposed solution.

Project Area	Prioritized Focus
Core automation	Flow Designer automatically classifies newly created tickets from the Short Description.
Data structure	Custom Incident Workflow table stores standardized ticket information.
Data consistency	Dependent Category and Subcategory fields restrict choices appropriately.
User communication	Send Email action confirms ticket creation to the caller.
Deployment	Complete the Update Set and export it as XML for reuse.

Expected Outcome

The proposed solution is a no-code ServiceNow Flow Designer workflow that automatically classifies school IT tickets, maintains structured ticket data, and sends an email notification after ticket creation. The project PDF states that this approach reduces manual effort, improves routing efficiency, and supports maintainability and scalability.
